

IKK γ (Phospho-S31) polyclonal antibody

Catalog: AP0628

Host: Rabbit

Reactivity: Human

BackGround:

The NF- κ B/Rel transcription factors are present in the cytosol in an inactive state, complexed with the inhibitory I κ B proteins. Most agents that activate NF- κ B do so through a common pathway based on phosphorylation-induced, proteasome-mediated degradation of I κ B. The key regulatory step in this pathway involves activation of a high molecular weight I κ B kinase (IKK) complex whose catalysis is generally carried out by three tightly associated IKK subunits. IKK α and IKK β serve as the catalytic subunits of the kinase and IKK γ serves as the regulatory subunit. Activation of IKK depends upon phosphorylation at Ser177 and Ser181 in the activation loop of IKK β (Ser176 and Ser180 in IKK α), which causes conformational changes, resulting in kinase activation.

Product:

Rabbit IgG, 1mg/ml in PBS with 0.02% sodium azide, 50% glycerol, pH7.2.

Molecular Weight:

~ 48 kDa

Swiss-Prot:

Q9Y6K9

Purification&Purity:

The antibody was affinity-purified from rabbit antiserum by affinity-chromatography using epitope-specific immunogen and the purity is > 95% (by SDS-PAGE).

Applications:

WB 1:200~1:500

Storage&Stability:

Store at 4 °C short term. Aliquot and store at -20 °C long term. Avoid freeze-thaw cycles.

Specificity:

IKK γ (Phospho-S31) polyclonal antibody detects endogenous levels of IKK γ protein only when phosphorylated at Ser31.

DATA:

Western blot (WB) analysis of IKK γ (Phospho-S31) polyclonal antibody at 1:200 dilution

Lane1:HEK293T whole cell lysate(30ug)

Lane2:HEK293T treated with Calyculin A(100 nM,30 minutes) whole cell lysate(30ug)
