

MAPK1 (ERK2) mouse monoclonal antibody

	,,,,,,, ,
Catalog: MB4142 Host: Mouse	Reactivity: Human, Dog, Rat, Monkey, Mouse
BackGround:	Isotype:
The protein encoded by this gene is a member of the	IgG1
MAP kinase family. MAP kinases, also known as extra-	DATA:
cellular signal-regulated kinases (ERKs), act as an inte- gration point for multiple biochemical signals, and are involved in a wide variety of cellular processes such as proliferation, differentiation, transcription regulation and development. The activation of this kinase requires its phosphorylation by upstream kinases. Upon activation, this kinase translocates to the nucleus of the stimulated cells, where it phosphorylates nuclear targets. Two alter- natively spliced transcript variants encoding the same protein, but differing in the UTRs, have been reported for this gene.
