The protein encoded by this gene is a cytokine that be-

longs to the tumor necrosis factor (TNF) ligand family. This protein preferentially induces apoptosis in trans-

formed and tumor cells, but does not appear to kill normal

cells although it is expressed at a significant level in most

normal tissues. This protein binds to several members of

TNFRSF10C/TRAILR3, TNFRSF10D/TRAILR4, and

possibly also to TNFRSF11B/OPG. The activity of this

protein may be modulated by binding to the decoy recep-

tors TNFRSF10C/TRAILR3, TNFRSF10D/TRAILR4,

and TNFRSF11B/OPG that cannot induce apoptosis. The

binding of this protein to its receptors has been shown to

trigger the activation of MAPK8/JNK, caspase 8, and

caspase 3. Alternatively spliced transcript variants en-

coding different isoforms have been found for this gene.
